A large majority of U.S. manufacturing executives are concerned about the issue of minerals and metals supply. Most believe minerals and metals demand will only increase over the next 5-10 years. Nearly 90% support limiting the permitting process to less than three years. 89% say this can be done without sacrificing necessary environmental reviews.

For a better, more sustainable and resilient U.S. economy, we must seek public policies that provide a more predictable and efficient permitting process to feed the manufacturing supply chain.
